CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC       SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RN   [4]
RP   IDENTIFICATION OF SUBSTRATE.
RX   MEDLINE=94038966; PubMed=7901002;
RA   Blasi J., Chapman E.R., Yamasaki S., Binz T., Niemann H., Jahn R.;
RT   "Botulinum neurotoxin C1 blocks neurotransmitter release by means of
RT   cleaving HPC-1/syntaxin.";
RL   EMBO J. 12:4821-4828(1993).
CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 152-154; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,

```
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 6; Fig 15b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 41; Page 327-329; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (NCTC 11219) type E neurotoxin, encoded by a DNA
CC   sequence (see AAV30585) in plasmid pETHisb. This vector is used to
CC   express BotE soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Disclosure; Fig 8; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Claim 26; Page 43-44; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast

PT   Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT   serotype A, useful for producing the neurotoxin for vaccination against
PT   botulism, comprises sequence expressible in host other than Clostridium.
XX
PS   Claim 33; Page 150-151; 166pp; English.
XX
CC   The invention relates to a nucleic acid molecule encoding a botulinum
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 41; Page 324-325; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Belgua strain) type E neurotoxin, encoded by a DNA
CC   sequence (see AAV30584) in plasmid pETHisb. This vector is used to
CC   express BotE soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 6; Fig 16b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 157-159; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC conditions characterised by hyperactivity of the lower motor neuron, and
CC to control autonomic nerve function or tiptoe-walking due to stiff
CC muscles common in children with cerebral palsy. The sequences are also
CC useful for screening for botulinum neurotoxin inhibitors. This sequence
CC represents a botulinum neurotoxin light chain serotype A protein

PT Novel composition, comprising superoxide dismutase linked by a cleavable
PT linker to a neuronal cell targeting component useful for delivering
PT superoxide dismutase to neuronal cells to treat ischemia.
XX
PS Disclosure; Page 48-51; 65pp; English.
XX
CC The present sequence represents a construct of the invention, comprising
CC a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC be cleaved by thrombin, and a heavy chain derived from botulinum
CC neurotoxin serotype F. The specification describes a composition for
CC delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC This component has a domain that binds to a neuronal cell and a domain
CC that translocates the SOD of the composition into the neuronal cell.
CC After translocation, the linker is cleaved to release the SOD. The
CC composition is useful for treating neuronal diseases caused or augmented
CC by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC disease, Huntington's disease and motor neurone diseases

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-|-ILE-
CC       181 BOND IN SNAP-25.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS.NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
```

```
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
CC       SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 152-154; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,

```
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT   Novel composition, comprising superoxide dismutase linked by a cleavable
PT   linker to a neuronal cell targeting component useful for delivering
PT   superoxide dismutase to neuronal cells to treat ischemia.
XX
PS   Disclosure; Page 48-51; 65pp; English.
XX
CC   The present sequence represents a construct of the invention, comprising
CC   a manganese superoxide dismutase (Mn-SOD) polypeptide, a linker that can
CC   be cleaved by thrombin, and a heavy chain derived from botulinum
CC   neurotoxin serotype F. The specification describes a composition for
CC   delivery of SOD to neuronal cells. The composition comprises SOD linked,
CC   by a cleavable linker, to a neuronal cell targeting component (NCTC).
CC   This component has a domain that binds to a neuronal cell and a domain
CC   that translocates the SOD of the composition into the neuronal cell.
CC   After translocation, the linker is cleaved to release the SOD. The
CC   composition is useful for treating neuronal diseases caused or augmented
CC   by oxidative stress, such as ischemic stroke, trauma, Parkinson's
CC   disease, Huntington's disease and motor neurone diseases

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 157-159; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC conditions characterised by hyperactivity of the lower motor neuron, and
CC to control autonomic nerve function or tiptoe-walking due to stiff
CC muscles common in children with cerebral palsy. The sequences are also
CC useful for screening for botulinum neurotoxin inhibitors. This sequence
CC represents a botulinum neurotoxin light chain serotype A protein

PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 26; Page 43-44; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 3; Fig 7b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.

```
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

CC   Clostridium botulinum type A neurotoxin (AAR95010) is processed to form a
CC   dimer composed of a light and a heavy chain. It is the product of the
CC   type A neurotoxin gene (AAT29244). The 50 kDa C-terminal portion of the
CC   heavy chain, or C fragment (see also AAR95008), was produced using a
CC   synthetic gene (AAT29245) having codon usage altered to improve
CC   expression in Escherichia coli. Fusion proteins of the type A toxin or C
CC   fragment, with e.g. maltose binding protein or polyhistidine affinity tag
CC   (see also AAR95008), are used to generate neutralising antitoxins and in
CC   vaccine compsns

PT Novel modified botulism toxin or tetanus toxin comprising a protease
PT cleavage site, is useful for treating conditions benefited by neurotoxin
PT activity.
XX
PS Disclosure; Fig 1; 19pp; English.
XX
CC The invention discloses modified botulism toxin (BoTOX) or tetanus toxin
CC (TeTOX) which contain new protease cleavage sites. These sites are
CC created in regions where the cleavage site is specifically susceptible to
CC cleavage by a protease that is present in effective levels only in a
CC tissue where toxicity is undesirable and where the cleavage site itself
CC does not inactivate the toxin. BoTOX and TeTOX are neurotoxins which are
CC highly potent and specific poisons of neural cells. The toxins are
CC synthesised in vivo as single chains, which are not toxic, but become
CC active when nicked, in a post-translational modification, to form
CC separate light and heavy chains which are linked through a disulphide
CC bond. The modified toxins are useful to treat conditions benefited by
CC neurotoxin activity (e.g. spastic conditions, including stabismus,
CC bephlarospasm and hemifacial spasm, brain injury, spinal cord injury,
CC stroke, multiple sclerosis and cerebral palsy) by administering the
CC toxins for their localised production. The advantage of the toxins are
CC that they are deactivated in tissues where toxic activity is undesirable
CC and activated at desired targets. The sequence presented is the
CC Clostridium botulinum botulism A toxin (BoNT/A) protein

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 41; Page 327-329; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (NCTC 11219) type E neurotoxin, encoded by a DNA
CC sequence (see AAV30585) in plasmid pETHisb. This vector is used to
CC express BotE soluble C fragment in Escherichia coli host cells, and the
CC recombinant C fragment was purified on an affinity column. The invention
CC relates to recombinant proteins derived from C. botulinum toxins,
CC especially type B and type E toxins. Methods are provided which allow for
CC the isolation of soluble recombinant proteins free of significant
CC endotoxin contamination. Preferred hosts for production of recombinant
CC proteins are E. coli, insect cells and yeast cells. The recombinant
CC toxins are used as immunogens for the production of vaccines and
CC antitoxins that are useful in the treatment of humans and animals at risk
CC of intoxication with clostridial toxin

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Disclosure; Fig 8; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 33; Page 125-126; 166pp; English.
XX
CC The invention relates to a nucleic acid molecule encoding a botulinum
CC neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC that is expressible in a host organism other than Clostridium, or has a
CC total A+T content that is less than about 70% The BoNT LC protein is
CC useful in vaccination against botulism, for eliciting protective immunity
CC in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC conditions characterised by hyperactivity of the lower motor neuron, and
CC to control autonomic nerve function or tiptoe-walking due to stiff
CC muscles common in children with cerebral palsy. The sequences are also
CC useful for screening for botulinum neurotoxin inhibitors. This sequence
CC represents a botulinum neurotoxin light chain serotype A protein

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 41; Page 324-325; 428pp; English.
XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (Belgua strain) type E neurotoxin, encoded by a DNA
CC sequence (see AAV30584) in plasmid pETHisb. This vector is used to
CC express BotE soluble C fragment in Escherichia coli host cells, and the
CC recombinant C fragment was purified on an affinity column. The invention
CC relates to recombinant proteins derived from C. botulinum toxins,
CC especially type B and type E toxins. Methods are provided which allow for
CC the isolation of soluble recombinant proteins free of significant
CC endotoxin contamination. Preferred hosts for production of recombinant
CC proteins are E. coli, insect cells and yeast cells. The recombinant
CC toxins are used as immunogens for the production of vaccines and
CC antitoxins that are useful in the treatment of humans and animals at risk
CC of intoxication with clostridial toxin

PT New polypeptide, useful for treating infections of Clostridium tetani,
PT comprises tetanus toxin fragment with a mutation in a loop region,.
XX
PS Disclosure; Page 39; 43pp; English.
XX
CC The present sequence is given in a specification relating to a novel
CC polypeptide comprising tetanus toxin (TeNT) fragment C or its immunogenic
CC fragment, containing a mutation in a loop region. The mutation results in
CC a reduction in the binding of TeNT fragment C or its immunogenic fragment
CC to gangliosides and primary motoneurones, and/or a reduction in the
CC ability of TeNT fragment C or its immunogenic fragment to undergo
CC retrograde transport. The polypeptide is useful for treating, preventing
CC and reducing the susceptibility to Clostridium tetani infection in a
CC human or animal, and also for producing antibodies which recognise groups
CC within TeNT polypeptides. Antibody produced against the polypeptide is
CC also useful for treating Clostridium tetani infection

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Title: Structural studies on the zinc-endopeptidase light chain of tetanus neurotoxin.
A;Reference number: S69348; MUID:95262688; PMID:7744050
A;Accession: S69348
A;Molecule type: protein
A;Residues: 2-31 <DEF>
C;Comment: The source of this protein was an extrachromosomal plasmid.
C;Comment: The precursor is cleaved by endogenous proteinase activity to form light (fra
dual chains are not toxic when separated). The amino end of the heavy chain (fragment B)
C;Comment: Fragment B forms ion channels in a lipid bilayer. Fragment C binds to ganglio

C;Comment: This potent neurotoxin binds to peripheral neuronal synapses, is internalized,
presynaptic neurons. It inhibits neurotransmitter release by proteolytic cleavage of syr
C;Function:
A;Description: blocks neuroexocytosis via hydrolysis of a Gln-Phe peptide bond in synaptc
C;Superfamily: tetanus toxin
C;Keywords: hydrolase; metalloproteinase; neurotoxin; transmembrane protein; zinc
F;2-457/Product: tentoxylysin light chain (fragment A) #status predicted <TTL>
F;461-1315/Product: tentoxylysin heavy chain (fragment B.C) #status experimental <TTH>

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-|-ILE-
CC       181 BOND IN SNAP-25.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   components of the botulinum toxin complex in proteolytic Clostridium
RT   botulinum types A, B, and F: evidence of chimeric sequences in the
RT   gene encoding the nontoxic nonhemagglutinin component.";
RL   Int. J. Syst. Bacteriol. 46:1105-1112(1996).
CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
```

```
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted (By similarity).
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC       SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   cleaving HPC-1/syntaxin.";
RL   EMBO J. 12:4821-4828(1993).
CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   "A family of cation ATPase-like molecules from Plasmodium
RT   falciparum.";
RL   J. Cell Biol. 120:385-398(1993).
CC   -!- CATALYTIC ACTIVITY: ATP + H(2)O = ADP + phosphate.
CC   -!- SUBCELLULAR LOCATION: Integral membrane protein.
CC   -!- SIMILARITY: Belongs to the cation transport ATPases family (P-type
CC       ATPases). Subfamily V.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

PT Modified toxin useful for systemic delivery of oral vaccines and
PT therapeutic agents.
XX
PS Example 1; Page 31-33; 37pp; English.
XX
CC The present sequence represents a modified serotype C botulinum toxin,
CC termed rBoNT/C, in which amino acids His-229, Glu-230 and His-233 of the
CC native sequence are substituted by Gly, Thr and Asn, respectively, i.e.
CC the zinc binding motif (see AAY05817) of the light chain holotoxin is
CC modified, resulting in loss of endoprotease activity. DNA coding for the

CC modified botulinum toxin (see AAX25521) was assembled from 3 separate
CC toxin fragments using PCR and site-directed mutagenesis. The modified
CC recombinant botulinum toxin maintains its ability to translocate from the
CC gut into the general circulation but is non-toxic. It can be used as an
CC oral vaccine for antigenic peptides including botulinum toxin (i.e. an
CC oral vaccine for botulism) or for the oral delivery of other therapeutic
CC agents to the general circulation

PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 24; Page 41-42; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences

```

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 5b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT   serotype A, useful for producing the neurotoxin for vaccination against
PT   botulism, comprises sequence expressible in host other than Clostridium.
XX
PS   Claim 33; Page 121-122; 166pp; English.
XX
CC   The invention relates to a nucleic acid molecule encoding a botulinum
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT   Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT   serotype A, useful for producing the neurotoxin for vaccination against
PT   botulism, comprises sequence expressible in host other than Clostridium.
XX
PS   Claim 33; Page 140-141; 166pp; English.
XX
CC   The invention relates to a nucleic acid molecule encoding a botulinum
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 45; Page 339-341; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Stockholm strain) type C1 neurotoxin, encoded by a
CC   DNA sequence (see AAV30588) in plasmid pETHisb. This vector is used to
CC   express BotC soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 6; Fig 13b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT serotype A, useful for producing the neurotoxin for vaccination against
PT botulism, comprises sequence expressible in host other than Clostridium.
XX
PS Claim 52; Page 147-149; 166pp; English.

```
XX
CC   The invention relates to a nucleic acid molecule encoding a botulinum
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT   Non-toxic immunogenic derivative of Clostridium botulinum neurotoxin type
PT   D, useful in vaccines for protection against botulism, comprises at least
PT   one amino acid mutation not present in the wild type D neurotoxins.
XX
PS   Claim 3, 4; Page 54-57; 66pp; English.
XX
CC   This sequence represents the amino acid sequence of a synthetic non-toxic
CC   immunogenic derivative of Clostridium botulinum type D toxin (BoNT).
CC   Botulinum neurotoxin causes botulism poisoning in cattle and sheep, and
CC   usually results in the death of the affected or poisoned animal. The non-
CC   toxic immunogenic fragments of the C. botulinum neurotoxin are useful in
CC   vaccines to protect animals (e.g. humans, cattle, sheep, pigs) against
CC   BoNT type D poisoning. The non-toxic fragments can be produced relatively
CC   simply and inexpensively (specifically by fermentation techniques). As
CC   the fragments are not toxic the risk to production staff is reduced

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 6b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   New protective epitopes of neurotoxin of Clostridium botulinum, useful
PT   for developing vaccines against neurotoxins of Clostridium botulinum and
PT   for identifying protective antibodies.
XX
PS   Claim 1; Col 25; 14pp; English.
XX
CC   The present sequence represents a fragment of the Clostridium botulinum
CC   neurotoxin (BoNT). It was produced by amplifying overlapping fragments of
CC   the BoNT gene. The amplified fragments were cloned expressed to identify
CC   immunogenic polypeptides which are capable of giving rise to protective
CC   antibodies. The BoNT polypeptide fragment are useful as vaccines, for
CC   immunizing against botulism, and as diagnostic agents to identify
CC   protective antibodies

XX
PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Example 3; Page 51; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. The present sequence represents the native BoNTA heavy
CC   chain N-terminal fragment (Hn) used in an exemplification of the present
CC   invention

Title: US-10-729-039-60
Perfect score: 1291
Sequence: 1 MPITINNFNYSDPVDNKNIL.....NYASLLESTSTHWGFVPVSE 1291

Scoring table: OLIGO
Gapop 60.0 , Gapext 60.0

Searched: 283366 seqs, 96191526 residues

Word size : 0

Total number of hits satisfying chosen parameters: 283366

Minimum DB seq length: 0
Maximum DB seq length: 2000000000

Post-processing: Listing first 45 summaries

Database : PIR_78:*
1: pir1:*
2: pir2:*
3: pir3:*
4: pir4:*

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).

```
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 60-LYS-|-LEU-61 BOND OF
CC       SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE D NEUROTOXIN IS SYNTHESIZED BY D
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.
CC   ---------------------------------------------------------------------

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure (By similarity).
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H) (By similarity).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Activates ubiquitin by first adenylating with ATP its
CC       carboxy-terminal glycine residue and thereafter linking this
CC       residue to the side chain of a cysteine residue in E1, yielding an
CC       ubiquitin-E1 thiolester and free AMP.
CC   -!- PATHWAY: Ubiquitin conjugation; first step.
CC   -!- SUBUNIT: Monomer.
CC   -!- PTM: The N-terminus is blocked.
CC   -!- MISCELLANEOUS: There are two active sites within the E1 molecule,
CC       allowing it to accomodate two ubiquitin moieties at a time, with a
CC       new ubiquitin forming an adenylate intermediate as the previous
CC       one is transferred to the thiol site.
CC   -!- MISCELLANEOUS: There are multiple genes encoding E1 in wheat.
CC   -!- SIMILARITY: Belongs to the ubiquitin-activating E1 family.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CLEAVES THE 76-GLN-|-PHE-77 BOND OF
CC       SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.
CC   ---------------------------------------------------------------------

PT Modified toxin useful for systemic delivery of oral vaccines and
PT therapeutic agents.
XX
PS Example 1; Page 31-33; 37pp; English.
XX
CC The present sequence represents a modified serotype C botulinum toxin,
CC termed rBoNT/C, in which amino acids His-229, Glu-230 and His-233 of the
CC native sequence are substituted by Gly, Thr and Asn, respectively, i.e.
CC the zinc binding motif (see AAY05817) of the light chain holotoxin is
CC modified, resulting in loss of endoprotease activity. DNA coding for the

CC modified botulinum toxin (see AAX25521) was assembled from 3 separate
CC toxin fragments using PCR and site-directed mutagenesis. The modified
CC recombinant botulinum toxin maintains its ability to translocate from the
CC gut into the general circulation but is non-toxic. It can be used as an
CC oral vaccine for antigenic peptides including botulinum toxin (i.e. an
CC oral vaccine for botulism) or for the oral delivery of other therapeutic
CC agents to the general circulation

XX
CC The invention relates to a nucleic acid molecule encoding a botulinum

```
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT toxin serotypes A-G, is used for inducing an immune response against
PT botulinum.
XX
PS Claim 24; Page 41-42; 54pp; English.
XX
CC The invention relates to novel vaccines that induce a protective immune
CC response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC DNA construct comprising a vector, and at least one nucleic acid fragment
CC comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC G. In preferred embodiments of the invention, the vector is a Venezuelan
CC equine encephalitis virus (VEE) replicon vector. Use of this vector
CC results in the production of large amounts of a protein encoded by a
CC sequence cloned into the replicon. The constructs are used to produce
CC vaccines against botulism. The proteins can also be used as diagnostic
CC tools for the diagnosis of botulism. The transformed host cells can be
CC used to analyse the effectiveness of drugs and agents which inhibit toxin
CC effects. The vaccine currently used against botulism is dangerous and
CC expensive to produce, and contains formalin, which is very painful for
CC the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC serotypes are represented in the formulation. The novel vaccine of
CC overcomes these problems, as it is easily purified, and available in
CC large quantities. It is also expressed in the lymph nodes for a better
CC immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC fragments used in the present invention. The DNA encoding these sequences
CC had been optimised for codon usage for expression in yeast

PT   New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT   heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT   against botulism.
XX
PS   Claim 3; Fig 5b; 73pp; English.
XX
CC   Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC   and then posttranslationally nicked, forming a dichain consisting of a
CC   100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC   disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC   -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
CC   which causes botulism. The nucleic acids are expressible in a recombinant
CC   organisms such as Escherichia coli or Pichia pastoris. The use of
CC   recombinant nucleic acids are advantageous since it eliminates the need
CC   to culture large quantities of hazardous toxin-producing bacterium.
CC   Production yield from the genetically engineered product is also high and
CC   cost of production is lower. The nucleic acids can be derived from
CC   Clostridium botulinum serotypes A-G

PT   Novel nucleic acid molecule encoding botulinum neurotoxin light chain
PT   serotype A, useful for producing the neurotoxin for vaccination against
PT   botulism, comprises sequence expressible in host other than Clostridium.
XX
PS   Claim 33; Page 121-122; 166pp; English.
XX
CC   The invention relates to a nucleic acid molecule encoding a botulinum
CC   neurotoxin light chain (BoNT LC) serotype A, where the DNA has a sequence
```

```
CC   that is expressible in a host organism other than Clostridium, or has a
CC   total A+T content that is less than about 70% The BoNT LC protein is
CC   useful in vaccination against botulism, for eliciting protective immunity
CC   in a mammal, for treating dystonias, spasticity, pain, ocular motility,
CC   facial dyskinesias, stiff-person syndrome, bladder dysfunction, segmental
CC   myoclonus, hyperkinetic disorders, cosmetic treatment of facial wrinkles,
CC   conditions characterised by hyperactivity of the lower motor neuron, and
CC   to control autonomic nerve function or tiptoe-walking due to stiff
CC   muscles common in children with cerebral palsy. The sequences are also
CC   useful for screening for botulinum neurotoxin inhibitors. This sequence
CC   represents a botulinum neurotoxin light chain serotype A protein

PT   Host cell containing recombinant expression vector encoding Clostridium
PT   botulinum type B or E toxin - useful to treat humans and other animals at
PT   risk of intoxication with clostridial toxin.
XX
PS   Example 45; Page 339-341; 428pp; English.
XX
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum (Stockholm strain) type C1 neurotoxin, encoded by a
CC   DNA sequence (see AAV30588) in plasmid pETHisb. This vector is used to
CC   express BotC soluble C fragment in Escherichia coli host cells, and the
CC   recombinant C fragment was purified on an affinity column. The invention
CC   relates to recombinant proteins derived from C. botulinum toxins,
CC   especially type B and type E toxins. Methods are provided which allow for
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

CC   can be used in recombinant expression vectors and expressed in
CC   transformed cells to produce peptide antigens useful for eliciting an
CC   immune response to give protective immunity against botulinum neurotoxin,
```

CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Host cell containing recombinant expression vector encoding Clostridium
PT botulinum type B or E toxin - useful to treat humans and other animals at
PT risk of intoxication with clostridial toxin.
XX
PS Example 35; Page 291-296; 428pp; English.
XX
CC This is the amino acid sequence of the type B toxin of Clostridium
CC botulinum Danish strain. The C fragment (see AAW68393-94) of the serotype
CC B toxin has been expressed as a histidine-tagged protein in Escherichia
CC coli. The invention relates to C. botulinum recombinant toxins. Methods
CC are provided which allow for the isolation of soluble recombinant
CC proteins free of significant endotoxin contamination. Preferred hosts for
CC production of the recombinant proteins are E. coli, insect cells and
CC yeast cells. The recombinant proteins are used as immunogens for the
CC production of vaccines and antitoxins that are useful in the treatment of
CC humans and animals at risk of intoxication with clostridial toxin.
CC (Updated on 17-OCT-2003 to standardise OS field)

XX
PS   Example 2; Page 91-94; 137pp; English.
XX
CC   The present sequence represents a recombinant neurotoxin protein from the
CC   present invention. The present invention describes recombinant neurotoxin
CC   proteins which comprise a first and second domain, where the first domain
CC   is adapted to cleave one or more vesicle or plasma-membrane associated
CC   proteins essential to exocytosis, and where the second domain is adapted:
CC   (a) to translocate the protein into a cell; (b) to increase the
CC   solubility of the protein compared to the solubility of the first domain
CC   on its own, or (c) both to translocate the protein into a cell and to
CC   increase the solubility of the protein compared to the solubility of the
CC   first domain on its own, the protein being free of clostridial neurotoxin
CC   (CN) and free of CN precursor that can be converted into toxin by
CC   proteolytic action. The recombinant proteins can be used as therapeutic
CC   agents for targeting cells expressing a relevant substrate. The products
CC   can also be used as immunogens and as non-toxic standards for the
CC   assessment and development of in vitro assays for the detection of
CC   functional botulinum or tetanus neurotoxins either in foodstuffs or in
CC   environmental samples

PT New polypeptide, useful for treating infections of Clostridium tetani,
PT comprises tetanus toxin fragment with a mutation in a loop region,.
XX
PS Disclosure; Page 39; 43pp; English.
XX
CC The present sequence is given in a specification relating to a novel
CC polypeptide comprising tetanus toxin (TeNT) fragment C or its immunogenic
CC fragment, containing a mutation in a loop region. The mutation results in
CC a reduction in the binding of TeNT fragment C or its immunogenic fragment
CC to gangliosides and primary motoneurones, and/or a reduction in the
CC ability of TeNT fragment C or its immunogenic fragment to undergo
CC retrograde transport. The polypeptide is useful for treating, preventing
CC and reducing the susceptibility to Clostridium tetani infection in a
CC human or animal, and also for producing antibodies which recognise groups
CC within TeNT polypeptides. Antibody produced against the polypeptide is
CC also useful for treating Clostridium tetani infection

PS Claim 4; Page 344-350; 434pp; English.
XX
CC Clostridium botulinum type A neurotoxin (AAR95010) is processed to form a
CC dimer composed of a light and a heavy chain. It is the product of the
CC type A neurotoxin gene (AAT29244). The 50 kDa C-terminal portion of the
CC heavy chain, or C fragment (see also AAR95008), was produced using a
CC synthetic gene (AAT29245) having codon usage altered to improve
CC expression in Escherichia coli. Fusion proteins of the type A toxin or C
CC fragment, with e.g. maltose binding protein or polyhistidine affinity tag
CC (see also AAR95008), are used to generate neutralising antitoxins and in
CC vaccine compsns

PT Novel modified botulism toxin or tetanus toxin comprising a protease
PT cleavage site, is useful for treating conditions benefited by neurotoxin
PT activity.
XX
PS Disclosure; Fig 1; 19pp; English.
XX
CC The invention discloses modified botulism toxin (BoTOX) or tetanus toxin
CC (TeTOX) which contain new protease cleavage sites. These sites are
CC created in regions where the cleavage site is specifically susceptible to
CC cleavage by a protease that is present in effective levels only in a
CC tissue where toxicity is undesirable and where the cleavage site itself
CC does not inactivate the toxin. BoTOX and TeTOX are neurotoxins which are
CC highly potent and specific poisons of neural cells. The toxins are
CC synthesised in vivo as single chains, which are not toxic, but become
CC active when nicked, in a post-translational modification, to form
CC separate light and heavy chains which are linked through a disulphide
CC bond. The modified toxins are useful to treat conditions benefited by
CC neurotoxin activity (e.g. spastic conditions, including stabismus,
CC bephlarospasm and hemifacial spasm, brain injury, spinal cord injury,
CC stroke, multiple sclerosis and cerebral palsy) by administering the
CC toxins for their localised production. The advantage of the toxins are
CC that they are deactivated in tissues where toxic activity is undesirable
CC and activated at desired targets. The sequence presented is the
CC Clostridium botulinum botulism A toxin (BoNT/A) protein

PT Non-toxic immunogenic derivative of Clostridium botulinum neurotoxin type
PT D, useful in vaccines for protection against botulism, comprises at least
PT one amino acid mutation not present in the wild type D neurotoxins.
XX
PS Claim 3, 4; Page 54-57; 66pp; English.
XX
CC This sequence represents the amino acid sequence of a synthetic non-toxic
CC immunogenic derivative of Clostridium botulinum type D toxin (BoNT).
CC Botulinum neurotoxin causes botulism poisoning in cattle and sheep, and
CC usually results in the death of the affected or poisoned animal. The non-
CC toxic immunogenic fragments of the C. botulinum neurotoxin are useful in
CC vaccines to protect animals (e.g. humans, cattle, sheep, pigs) against
CC BoNT type D poisoning. The non-toxic fragments can be produced relatively
CC simply and inexpensively (specifically by fermentation techniques). As
CC the fragments are not toxic the risk to production staff is reduced

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

CC -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC ENDOPEPTIDASE THAT CLEAVES SYNTAXIN.
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC detected action on small molecule substrates.
CC -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).

```
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- MISCELLANEOUS: BOTULINUM TYPE C1 NEUROTOXIN IS SYNTHESIZED BY C
CC       STRAIN OF CLOSTRIDIUM BOTULINUM WHICH CARRY THE APPROPRIATE
CC       BACTERIOPHAGE.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RT   "Nucleotide sequence of the gene coding for Clostridium botulinum
RT   (Clostridium argentinense) type G neurotoxin: genealogical comparison
RT   with other clostridial neurotoxins.";
RL   Biochim. Biophys. Acta 1216:487-491(1993).
CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted (By similarity).
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: TETANUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 76-GLN-|-PHE-77
CC       BOND OF SYNAPTOBREVIN-2.
CC   -!- CATALYTIC ACTIVITY: Hydrolysis of 76-Gln-|-Phe-77 bond in
CC       synaptobrevin 2.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: THE PRECURSOR POLYPEPTIDE IS SUBSEQUENTLY CLEAVED TO
CC       YIELD SUBCHAINS L AND H. THESE REMAIN LINKED BY A DISULFIDE BRIDGE
CC       AND ARE NON-TOXIC AFTER SEPARATION.
CC   -!- MISCELLANEOUS: THE C-TERMINAL OF THE HEAVY CHAIN BINDS TO
CC       GANGLIOSIDE RECEPTORS.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 180-ARG-|-ILE-
CC       181 BOND IN SNAP-25.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC       binds with high affinity to peripheral neuronal presynaptic
CC       membrane, is then internalized by receptor-mediated endocytosis.
CC       The C-terminus of the heavy chain (H) is responsible for the
CC       adherence of the toxin to the cell surface while the N-terminus
CC       mediates transport of the light chain from the endocytic vesicle
CC       to the cytosol. After translocation, the light chain (L)
CC       hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC       neurotransmitter release. Inhibition of acetylcholine release
CC       results in flaccid paralysis, with frequent heart or respiratory
CC       failure.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit.
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H).
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- PHARMACEUTICAL: Available under the name BOTOX (Allergan) for
CC       the treatment of strabismus and blepharospasm associated with
CC       dystonia and cervical dystonia. Also used for the treatment of
CC       hemifacial spasm and a number of other neurological disorders
CC       characterized by abnormal muscle contraction.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

CC   -!- FUNCTION: BOTULINUS TOXIN ACTS BY INHIBITING NEUROTRANSMITTER
CC       RELEASE. IT BINDS TO PERIPHERAL NEURONAL SYNAPSES, IS INTERNALIZED
CC       AND MOVES BY RETROGRADE TRANSPORT UP THE AXON INTO THE SPINAL CORD
CC       WHERE IT CAN MOVE BETWEEN POSTSYNAPTIC AND PRESYNAPTIC NEURONS. IT
CC       INHIBITS NEUROTRANSMITTER RELEASE BY ACTING AS A ZINC
CC       ENDOPEPTIDASE THAT CATALYZES THE HYDROLYSIS OF THE 58-GLN-|-LYS-59
CC       BOND OF SYNAPTOBREVINS-1 AND -2.
CC   -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC       neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC       detected action on small molecule substrates.
CC   -!- COFACTOR: Binds 1 zinc ion per subunit (By similarity).
CC   -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC       heavy chain (H). The light chain has the pharmacological activity,
CC       while the N- and C-terminal of the heavy chain mediate channel
CC       formation and toxin binding, respectively.
CC   -!- SUBCELLULAR LOCATION: Secreted.
CC   -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC       botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC   -!- SIMILARITY: Belongs to peptidase family M27.

RN [2]
RP SEQUENCE OF 1-65 FROM N.A.
RC STRAIN=Kyoto-F;
RX MEDLINE=97016817; PubMed=8863443;
RA East A.K., Bhandari M., Stacey J.M., Campbell K.D., Collins M.D.;
RT "Organization and phylogenetic interrelationships of genes encoding
RT components of the botulinum toxin complex in proteolytic Clostridium
RT botulinum types A, B, and F: evidence of chimeric sequences in the
RT gene encoding the nontoxic nonhemagglutinin component.";
RL Int. J. Syst. Bacteriol. 46:1105-1112(1996).
CC -!- FUNCTION: Inhibits acetylcholine release. The botulinum toxin
CC   binds with high affinity to peripheral neuronal presynaptic
CC   membrane, is then internalized by receptor-mediated endocytosis.
CC   The C-terminus of the heavy chain (H) is responsible for the
CC   adherence of the toxin to the cell surface while the N-terminus
CC   mediates transport of the light chain from the endocytic vesicle
CC   to the cytosol. After translocation, the light chain (L)
CC   hydrolyzes the 197-Gln-|-Arg-198 bond in SNAP-25, thereby blocking
CC   neurotransmitter release. Inhibition of acetylcholine release
CC   results in flaccid paralysis, with frequent heart or respiratory
CC   failure (By similarity).
CC -!- CATALYTIC ACTIVITY: Limited hydrolysis of proteins of the
CC   neuroexocytosis apparatus, synaptobrevins, SNAP25 or syntaxin. No
CC   detected action on small molecule substrates.
CC -!- SUBUNIT: Disulfide-linked heterodimer of a light chain (L) and a
CC   heavy chain (H) (By similarity).
CC -!- SUBCELLULAR LOCATION: Secreted.
CC -!- MISCELLANEOUS: There are seven antigenically distinct forms of
CC   botulinum neurotoxin: Types A, B, C1, D, E, F, and G.
CC -!- SIMILARITY: Belongs to peptidase family M27.

XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (Stockholm strain) type C1 neurotoxin, encoded by a
CC DNA sequence (see AAV30588) in plasmid pETHisb. This vector is used to
CC express BotC soluble C fragment in Escherichia coli host cells, and the
CC recombinant C fragment was purified on an affinity column. The invention
CC relates to recombinant proteins derived from C. botulinum toxins,
CC especially type B and type E toxins. Methods are provided which allow for

```
CC   the isolation of soluble recombinant proteins free of significant
CC   endotoxin contamination. Preferred hosts for production of recombinant
CC   proteins are E. coli, insect cells and yeast cells. The recombinant
CC   toxins are used as immunogens for the production of vaccines and
CC   antitoxins that are useful in the treatment of humans and animals at risk
CC   of intoxication with clostridial toxin

PT   Novel Botulinum neurotoxin vaccine comprising a fragment from botulinum
PT   toxin serotypes A-G, is used for inducing an immune response against
PT   botulinum.
XX
PS   Claim 24; Page 41-42; 54pp; English.
XX
CC   The invention relates to novel vaccines that induce a protective immune
CC   response against botulinum neurotoxin (BoNT) serotypes A, B, C, D, E, F
CC   and G (BoNTA-BoNTG). The vaccine of the invention is novel recombinant
CC   DNA construct comprising a vector, and at least one nucleic acid fragment
CC   comprising a C-terminal heavy chain fragment (Hc) from BoNT serotypes A-
CC   G. In preferred embodiments of the invention, the vector is a Venezuelan
CC   equine encephalitis virus (VEE) replicon vector. Use of this vector
CC   results in the production of large amounts of a protein encoded by a
CC   sequence cloned into the replicon. The constructs are used to produce
CC   vaccines against botulism. The proteins can also be used as diagnostic
CC   tools for the diagnosis of botulism. The transformed host cells can be
CC   used to analyse the effectiveness of drugs and agents which inhibit toxin
CC   effects. The vaccine currently used against botulism is dangerous and
CC   expensive to produce, and contains formalin, which is very painful for
CC   the recipient. Also, the vaccine is incomplete, in that only 5 of the 7
CC   serotypes are represented in the formulation. The novel vaccine of
CC   overcomes these problems, as it is easily purified, and available in
CC   large quantities. It is also expressed in the lymph nodes for a better
CC   immune response. Sequences AAY77134-Y77139 represent synthetic BoNT Hc
CC   fragments used in the present invention. The DNA encoding these sequences
CC   had been optimised for codon usage for expression in yeast

PT New nucleic acids encoding the carboxy- or amino-terminal portions of the
PT heavy chain of botulinum neurotoxin of serotype A-G, useful as vaccine
PT against botulism.
XX
PS Claim 3; Fig 5b; 73pp; English.
XX
CC Botulism neurotoxins are translated as a single 150 kDa polypeptide chain
CC and then posttranslationally nicked, forming a dichain consisting of a
CC 100 kDa heavy chain and a 50 kDa light chain which remain linked by a
CC disulfide bond. Nucleic acids encoding the carboxy-terminal (HC) or amino
CC -terminal (HN) portion of the heavy chain of botulinum neurotoxin (BoNT)
CC can be used in recombinant expression vectors and expressed in
CC transformed cells to produce peptide antigens useful for eliciting an
CC immune response to give protective immunity against botulinum neurotoxin,
CC which causes botulism. The nucleic acids are expressible in a recombinant
CC organisms such as Escherichia coli or Pichia pastoris. The use of
CC recombinant nucleic acids are advantageous since it eliminates the need
CC to culture large quantities of hazardous toxin-producing bacterium.
CC Production yield from the genetically engineered product is also high and
CC cost of production is lower. The nucleic acids can be derived from
CC Clostridium botulinum serotypes A-G

PT Modified toxin useful for systemic delivery of oral vaccines and
PT therapeutic agents.
XX
PS Example 1; Page 31-33; 37pp; English.
XX
CC The present sequence represents a modified serotype C botulinum toxin,
CC termed rBoNT/C, in which amino acids His-229, Glu-230 and His-233 of the
CC native sequence are substituted by Gly, Thr and Asn, respectively, i.e.
CC the zinc binding motif (see AAY05817) of the light chain holotoxin is

```
CC   modified, resulting in loss of endoprotease activity. DNA coding for the
CC   modified botulinum toxin (see AAX25521) was assembled from 3 separate
CC   toxin fragments using PCR and site-directed mutagenesis. The modified
CC   recombinant botulinum toxin maintains its ability to translocate from the
CC   gut into the general circulation but is non-toxic. It can be used as an
CC   oral vaccine for antigenic peptides including botulinum toxin (i.e. an
CC   oral vaccine for botulism) or for the oral delivery of other therapeutic
CC   agents to the general circulation

PT   Non-toxic immunogenic derivative of Clostridium botulinum neurotoxin type
PT   D, useful in vaccines for protection against botulism, comprises at least
PT   one amino acid mutation not present in the wild type D neurotoxins.
XX
PS   Claim 3, 4; Page 54-57; 66pp; English.
XX
CC   This sequence represents the amino acid sequence of a synthetic non-toxic
CC   immunogenic derivative of Clostridium botulinum type D toxin (BoNT).
CC   Botulinum neurotoxin causes botulism poisoning in cattle and sheep, and
CC   usually results in the death of the affected or poisoned animal. The non-
CC   toxic immunogenic fragments of the C. botulinum neurotoxin are useful in
CC   vaccines to protect animals (e.g. humans, cattle, sheep, pigs) against
CC   BoNT type D poisoning. The non-toxic fragments can be produced relatively
CC   simply and inexpensively (specifically by fermentation techniques). As
CC   the fragments are not toxic the risk to production staff is reduced

```

```
CC   This is the amino acid sequence of the histidine-tagged C fragment of
CC   Clostridium botulinum seotype D neurotoxin, encoded by a DNA sequence
CC   (see AAV30591) in plasmid pETHisb. This vector can be used to express
CC   BotD soluble C fragment in Escherichia coli host cells, with the
CC   recombinant C fragment being purified on an affinity column. The
CC   invention relates to recombinant proteins derived from C. botulinum
CC   toxins, especially type B and type E toxins. Methods are provided which
CC   allow for the isolation of soluble recombinant proteins free of
CC   significant endotoxin contamination. Preferred hosts are E. coli, insect
CC   cells and yeast cells. The recombinant toxins are used as immunogens for
CC   the production of vaccines and antitoxins useful in the treatment of
CC   humans and animals at risk of intoxication with clostridial toxin

XX
CC This is the amino acid sequence of the histidine-tagged C fragment of
CC Clostridium botulinum (202F strain) type F neurotoxin, encoded by a DNA
CC sequence (see AAV30593) in plasmid pETHisb. This vector can be used to
CC express BotC soluble C fragment in Escherichia coli host cells, with the
CC recombinant C fragment being purified on an affinity column. The
CC invention relates to recombinant proteins derived from C. botulinum
CC toxins, especially type B and type E toxins. Methods are provided which
CC allow for the isolation of soluble recombinant proteins free of
CC significant endotoxin contamination. Preferred hosts for production of
CC recombinant proteins are E. coli, insect cells and yeast cells. The
CC recombinant toxins are used as immunogens for the production of vaccines
CC and antitoxins that are useful in the treatment of humans and animals at
CC risk of intoxication with clostridial toxin

CC The present invention describes the preparation of pyran-2-one
CC derivatives. The preparation method comprises contacting carbonyl
CC compounds with microbes containing a polyketide synthase gene. Pyran-2-
CC one derivatives can be used as synthetic intermediates for drugs and
CC agricultural chemicals. They can also be used as additives for
CC thermosensible transfer paper. The present sequence represents the
CC Streptomyces griseus RppA protein with an N-terminal His tag, which is
CC used in an example from the present invention
